

1. A class is a reference type, while a struct is a value type. A class works with a reference to an object, while a struct stores its value directly.
2. Classes are better for large applications because they support features like inheritance and polymorphism. They also make it easier to organize and reuse code.
3. Shipment is the parent class.
4. StandardShipment, ExpressShipment, and InternationalShipment are child classes of Shipment.
5. ExpressShipment inherits TrackingCode, Description, Weight, DeliveryFee, Destination, EstimatedCost, UpdateDeliveryFee(), and PrintShipment() from Shipment.
6. Inheritance lets us reuse the common code from the parent class instead of writing the same code again in every class. This makes the project easier to maintain and avoids repeated code.
